

Beginner Discord Bot Guide

This guide shows you how to setup the CRAW Discord bot using GitHub and Railway. The FULL bot code is included below so beginners can directly copy it. CRAW is a small custom Discord bot made with JavaScript and discord.js. It welcomes people to your server and automatically posts YouTube uploads into Discord

1 — Create a GitHub Repository

Go to github.com and create a new repository. Name it something like raw-bot.

2 — Create index.js

Create a file named index.js and paste the bot code into it.

3 — Create package.json

Create another file named package.json and paste the package.json code into it.

4 — Create Your Discord Bot

Go to the [Discord Developer Portal](https://discord.com/developers). Create a new application, add a bot, enable Server Members Intent, and copy your bot token.

5 — Invite The Bot

Go to OAuth2 → URL Generator. Select bot and give it these permissions: Send Messages, Embed Links, and Read Messages/View Channels.

6 — Add Your YouTube Channel

Go to commentpicker.com/youtube-channel-id.php and get your YouTube channel ID. Replace the example channel name and ID inside the script with your own.

7 — Rename Discord Channels

Inside the script, change the channel names to match your own Discord server channels.

8 — Deploy Using Railway

Go to railway.app, login with GitHub, create a new project, and deploy from your GitHub repository.

9 — Add Your Token

Inside Railway, open Variables and create a variable named TOKEN. Paste your Discord bot token there.

DONE!

Your bot should now stay online 24/7. Whenever you edit your GitHub files, Railway updates the bot automatically

Never share your token Anyone with the token controls your bot
Use GitHub Makes updating the bot easier Use Railway Free and beginner-friendly hosting
